

(a) output layer: the four strongest stimuli of every factor, with its dominant class and that class's share of the factor

(b) one layer back (conv4): the six sub-factors of a circuit take near-disjoint groups of its stimuli (sibling top sets overlap 0.06)

(c) conv1 factors of f_9 , with class purity and RGB input arbor

the same four color factors in all 10 circuits (cosine 0.99)

(d) across depth
